

commands **message commands** **application commands**
context menus **slash commands**

Commands Help

Minato Namikaze provides 2 different types of commands, namely **Message Commands** and **Application Commands**

Message Commands

These types of commands can easily typing

`[prefix]command_name sub_command_name` in discord [See the GIF below]

The prefix for the bot is `)` or `m!` or `minato`
i.e. either of following would work
`)help`
`m!help`
`minato help`

Also by mentioning Minato you invoke commands i.e.
`@Minato Namikaze help`

And in DM's only `m!` works i.e. only `m!help` in DM's

Application Commands

Application commands are commands that an application can register to Discord. They provide users a first-class way of interacting directly with your application that feels deeply integrated into Discord. : This is the [Discord definition](#)

Here in **Minato Namikaze** the application commands are categorized into two different types:

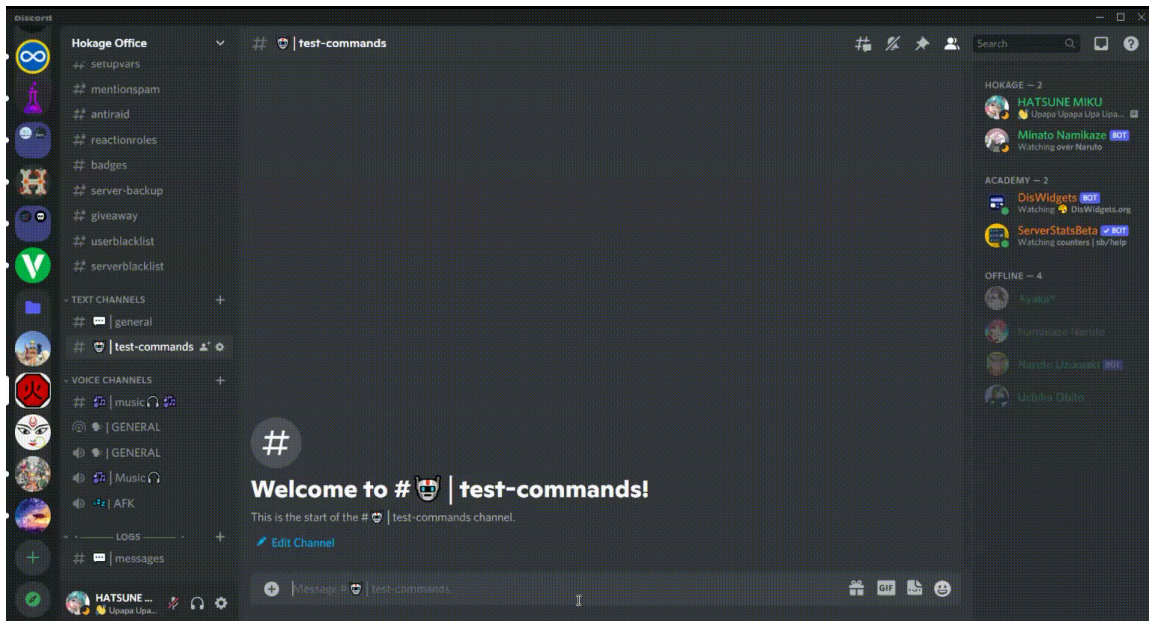

- [Slash Commands](#)
- [Context Menus](#)

Slash Commands

Slash Commands are the new, exciting way to interact with bots on Discord. With Slash Commands, all you have to do is type `/` and you're ready to use the bot. You can easily see all the commands a bot has, and validation and error handling help you get the command right the first time.

Context Menus

Context Menus are further divided into two different types:

- [User Context Menus](#)
- [Message Context Menus](#)

To get a list of full application commands click the button below:

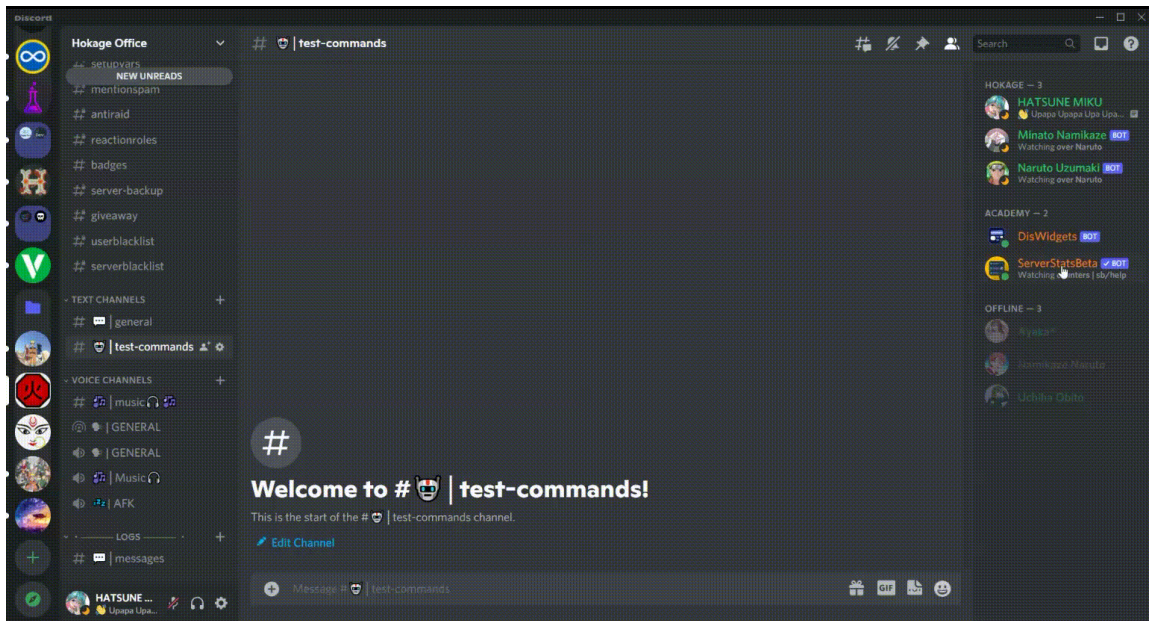

[Application Commands List](#)

User Context Menus

User Context Menus are application commands that appear on the context menu (right click or tap) of users. They don't take any arguments.

Message Context Menus

Message Context Menus are application commands that appear on the context menu (right click or tap) of messages. They don't take any arguments.
